- Describe whether the plot shows a summary of the data, or all of the data points.
- Describe the insight your plot can provide, for example:
    - Are the data evenly distributed, or skewed?
    - If your plot contains more than one variable, does the plot reveal any interesting relationships?

Bill Length of 3 Penguin Species

The box plot shows a summary of the data rather than of all the data points. The box plot shows that our data is evenly distributed and unskewed. Our box plot reveals that the Adelie species has the lowest median value for bill length, therefore it is associated with the lowest bill length.

Body mass vs Flipper length

This scatter plot shows all of the data points. The data seems to be evenly distributed without significant skew. This plot suggests a positive linear relationship between body mass and flipper length.
